

Why Psygil Pays For Itself In A Psychology Practice

Psygil is not positioned as a generic writing assistant. It is a local-first psychology workspace built to reduce case assembly time, report drafting time, review time, legal response time, and records administration while keeping the clinician responsible for diagnosis and final judgment.

SOLO BREAK-EVEN

3 hours/mo

At a \$200 to \$250 hourly value, Professional clears its monthly price quickly.

PRACTICE BREAK-EVEN

6 to 8 hours/mo

A 3-seat practice needs only a few shared hours saved to justify the plan.

ENTERPRISE BREAK-EVEN

12 to 15 hours/mo

Centralized workflows, admin controls, and compliance support create leverage.

Executive Summary

Psychological evaluations create heavy administrative drag around high-stakes professional judgment. The clinician still interviews, tests, diagnoses, and signs the work. Psygil compresses the surrounding labor: organizing records, summarizing source material, drafting structured report sections, checking consistency, preparing discovery-ready files, and supporting requests for electronic health information.

The financial case is simple. If Psygil saves a solo clinician one afternoon per month, Professional pays for itself. In a group practice, the break-even point is even lower because shared templates, common workflows, and centralized administration spread the benefit across multiple clinicians and staff.

Estimated Monthly Savings

Practice Type	Realistic Time Savings	Monthly Operating Value	Why This Is Credible
Solo clinician	15 to 35 hours	\$3,000 to \$8,750	Savings come from repeatable drafting, source review, case setup, and fewer document hunts.
Small practice, 3 clinicians	60 to 120 hours	\$12,000 to \$30,000	Templates, shared structure, and admin support multiply the same case-level gains across clinicians.
Enterprise, 10 clinicians	200 to 500 hours	\$40,000 to \$125,000	Operational savings include clinical workflow, records administration, legal response, onboarding, and compliance support.

Break-even By Tier

Tier	Monthly Price	Break-even Time Saved	Strategic Role
Professional	\$599	2.4 to 3 hours per month	Main solo clinician business.
Practice	\$1,499	6 to 8 total hours per month	3-seat team plan that anchors shared workflow value.
Enterprise	\$3,000+	12 to 15 total hours per month	Services, compliance, onboarding, admin controls, and larger deployments.

Where The Time Is Saved

Work Area	Current Friction	Realistic Savings
Case setup	Creating folders, intake structure, document lists, templates, and naming conventions.	30 to 90 minutes per case.
Records review	Re-reading PDFs, transcripts, prior reports, referral material, and collateral documents.	1 to 4 hours per case.
Report drafting	Turning notes, test data, collateral information, and impressions into usable sections.	2 to 8 hours per case.
Consistency review	Checking names, dates, pronouns, diagnoses, test references, opinions, and internal contradictions.	30 minutes to 2 hours per case.
Legal response prep	Finding what was considered, what was excluded, and what supports a stated opinion.	1 to 5 hours per event.
EHI and records requests	Locating, packaging, redacting, and validating records, reports, transcripts, and logs.	1 to 4 hours per request.
HIPAA support	Reviewing disclosure boundaries, redaction needs, local control, and record separation.	30 minutes to 3 hours per event.
Practice administration	Managing repeatable workflows, templates, version history, onboarding, and report standards.	5 to 20 hours per month.

Why These Estimates Are Real

These estimates are grounded in work that already exists inside psychological practices. Psygil does not assume the clinician spends less time making clinical judgments. It assumes less time is wasted reconstructing case context, moving between Word, PDFs, folders, transcripts, email, and notes, rebuilding similar report structures, hunting for source material, and preparing files for legal or HIPAA-sensitive exchange.

The highest-confidence savings are in repeatable document work: drafting, organizing, summarizing, reviewing, and packaging. The lower-confidence savings are in clinical reasoning itself, which remains with the clinician.

Legal, EHI, and HIPAA Operating Value

For forensic and clinical practices, much of the hidden cost appears after the evaluation is complete. Attorneys, courts, patients, families, records custodians, and administrators may ask what was reviewed, what was relied on, what was excluded, what changed, and what can be produced without exposing unrelated material.

Psygil reduces this burden by creating a cleaner local case workspace from the beginning. The value is both time savings and risk reduction: faster record location, cleaner export preparation, better separation between raw records and working materials, easier redaction review, local-first control over sensitive files, and better auditability of what was created, reviewed, and finalized.

Recommended positioning: Psygil pays for itself through time savings, but practices buy it because it makes high-stakes psychological work more organized, defensible, and easier to administer.

Use This Claim Carefully

The credible claim is not that Psygil makes HIPAA compliance automatic, replaces attorney review, or performs diagnosis. The credible claim is that Psygil gives practices a cleaner local workspace for managing sensitive psychological evaluation materials, so records requests, legal review, and disclosure preparation take less time and create less operational risk.

Estimates are planning ranges for sales and executive discussion. Actual savings depend on case volume, evaluation complexity, hourly value, practice workflow, staff structure, and how consistently the practice uses Psygil. Psygil does not diagnose. The clinician diagnoses. Always.
